

Introducción a la Fotografía 3D

UBA/FCEN Marzo 27 – Abril 12 2013

Clase 7 : Miercoles Abril 10

Gabriel Taubin

Brown University

BROWN

Course Schedule

- Structured Lighting
- Robust Pixel Classification
- ***Projector Calibration / Structured Light Reconstruction***
- Projector Calibration / Structured Light Reconstruction
- Surface Reconstruction from Point Clouds
- Elementary Mesh Processing

Summary of Camera Calibration

Image Sequence for Camera Calibration

Estimated Camera Lens Distortion

Camera Calibration Procedure

- Use the *Camera Calibration Toolbox for Matlab* or *OpenCV*

Normalized Ray	Distorted Ray (4 th -order radial + tangential)	Predicted Image-plane Projection
$\mathbf{x}_n = \begin{bmatrix} X_c/Z_c \\ Y_c/Z_c \end{bmatrix} = \begin{bmatrix} x \\ y \end{bmatrix}$	$\mathbf{x}_d = \begin{bmatrix} x_d(1) \\ x_d(2) \end{bmatrix} = \left(1 + kc(1)r^2 + kc(2)r^4 + kc(5)r^6 \right) \mathbf{x}_n + d\mathbf{x}$ $d\mathbf{x} = \begin{bmatrix} 2 kc(3) x y + kc(4) (r^2 + 2x^2) \\ kc(3) (r^2 + 2y^2) + 2 kc(4) x y \end{bmatrix}$	$x_p = fc(1) (x_d(1) + \alpha_c x_d(2)) + cc(1)$ $y_p = fc(2) x_d(2) + cc(2)$

Projector Calibration

Calibration Procedure

- Consider projector an inverse camera (maps intensities to 3D rays)

Projector Calibration

Calibration Procedure

- Consider projector an inverse camera (maps intensities to 3D rays)
- Identify printed fiducials in each image

Projector Calibration

Calibration Procedure

- Consider projector an inverse camera (maps intensities to 3D rays)
- Identify printed fiducials in each image
- Use fiducials to find 3D calibration plane

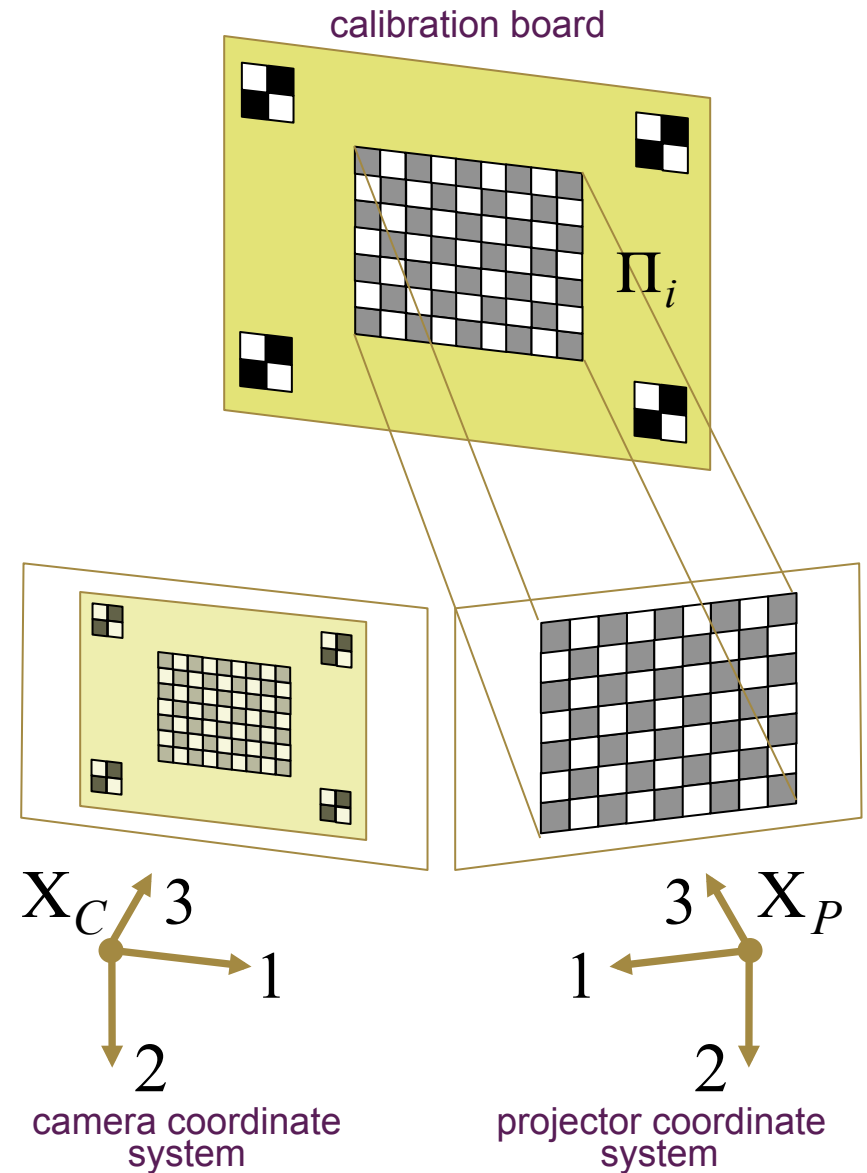

Projector Calibration

Calibration Procedure

- Consider projector an inverse camera (maps intensities to 3D rays)
- Identify printed fiducials in each image
- Use fiducials to find 3D calibration plane Π_i
- Project checkerboard on calibration board

Projector Calibration

Calibration Procedure

- Consider projector an inverse camera (maps intensities to 3D rays)
- Identify printed fiducials in each image
- Use fiducials to find 3D calibration plane
- Project checkerboard on calibration board
- Find ray-plane intersection for each corner

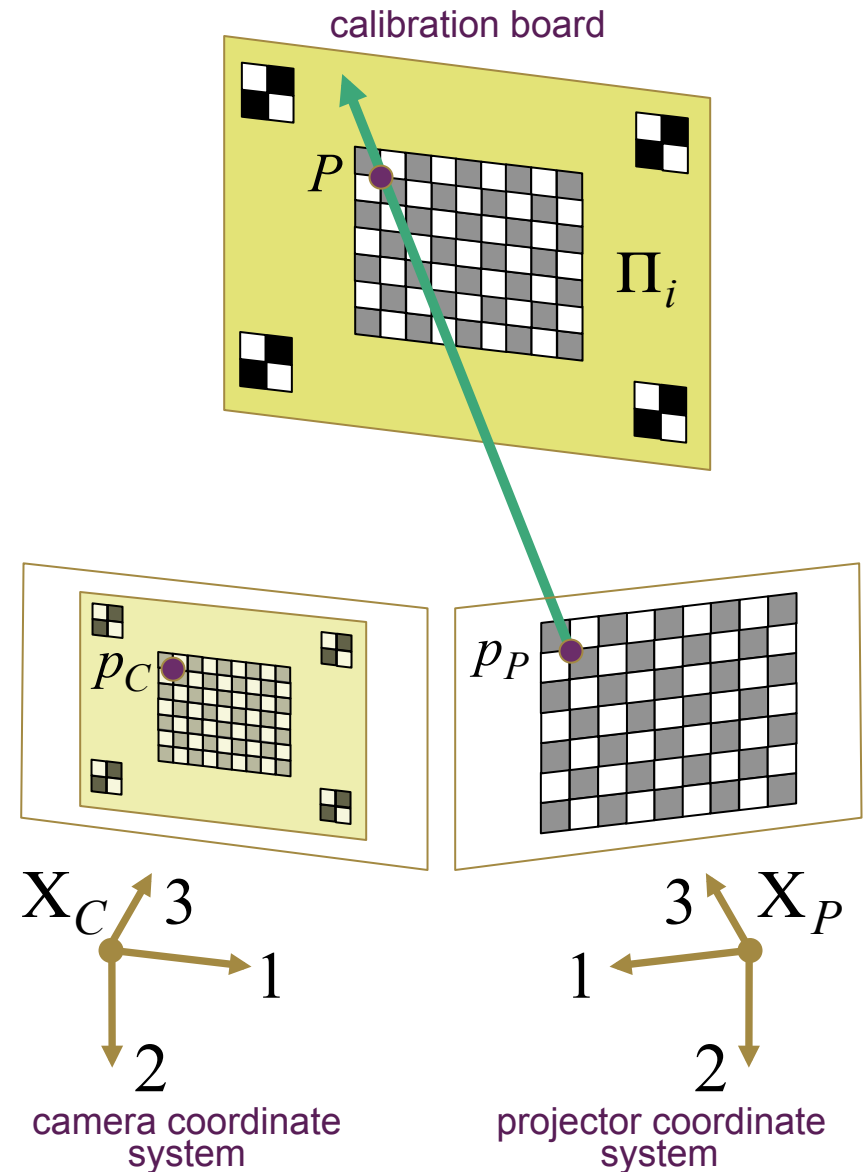

Projector Calibration

Calibration Procedure

- Consider projector an inverse camera (maps intensities to 3D rays)
- Identify printed fiducials in each image
- Use fiducials to find 3D calibration plane
- Project checkerboard on calibration board
- Find ray-plane intersection for each corner

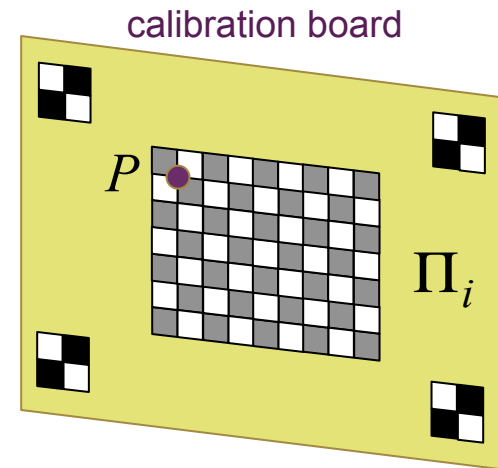

Projector Calibration

Calibration Procedure

- Consider projector an inverse camera (maps intensities to 3D rays)
- Identify printed fiducials in each image
- Use fiducials to find 3D calibration plane
- Project checkerboard on calibration board
- Find ray-plane intersection for each corner
- Use 2D→3D correspondences to estimate intrinsic/extrinsic projector calibration (and radial distortion model)

Projector-Camera Calibration Results

Projector-Camera Calibration Results

- Implemented complete toolbox for projector-camera calibration (available for *Matlab* and *OpenCV*)
- Sufficient accuracy for structured lighting applications
- Software and documentation available on the course website

How to Get the Source Code

The screenshot shows a Mozilla Firefox browser window with the address bar displaying `http://mesh.brown.edu/byo3d/source.html`. The page title is "Build Your Own 3D Scanner: 3D Photography for Beginners". The main content area features a navigation menu on the left with items: "Course Info", "Speaker Bios", "Syllabus", "Notes and Slides", "Source Code", and "Links". The "Source Code" item is highlighted. The main content area displays the heading "3D Scanning using Structured Lighting" and includes a row of four images: a 3D wireframe model of a cube, a 3D wireframe model of a sphere, a 3D wireframe model of a complex object, and a 3D wireframe model of a sphere. Below this, there is a row of four images: a photograph of a 3D scanner setup, a 3D wireframe model of a bust, a 3D wireframe model of a bust, and a 3D wireframe model of a bust. The text below the images describes the project's goal and provides information about the source code.

3D Scanning using Structured Lighting

The goal of this project is to build a 3D scanner using one or more digital cameras and a single projector. While the previous "desktop scanner" project is inexpensive, it has limited practical utility. The scanning process requires manual manipulation of the stick, and the time required to sweep the shadow plane across the scene limits the system to reconstructing static objects. Manual translation can be eliminated by using a digital projector to sequentially display patterns (e.g., a single stripe translated over time). Furthermore, various structured light illumination sequences, consisting of a series of projected images, can be used to efficiently solve for the camera pixel to projector column (or row) correspondences. Here we provide MATLAB and C/C++ source code (implemented using [OpenCV](#)) to help you build your own structured light scanner. Please consult Chapter 5 of the course notes for additional details on the source code and test sequences.

Chapter 5

Structured Lighting

In this chapter we describe how to build a structured light scanner using one or more digital cameras and a single projector. While the “desktop scanner” [BP] implemented in the previous chapter is inexpensive, it has limited practical utility. The scanning process requires manual manipulation of the stick, and the time required to sweep the shadow plane across the scene limits the system to reconstructing static objects. Manual translation can be eliminated by using a digital projector to sequentially display patterns (e.g., a single stripe translated over time). Furthermore, various *structured light* illumination sequences, consisting of a series of projected images, can be used to efficiently solve for the camera pixel to projector column (or row) correspondences.

By implementing your own structured light scanner, you will directly extend the algorithms and software developed for the swept-plane systems in the previous chapter. Reconstruction will again be accomplished using ray-plane triangulation. The key difference is that correspondences will now be established by decoding certain structured light sequences. At the time of writing, the software accompanying this chapter was developed in MATLAB. We encourage the reader to download that version, as well as any updates, from the course website at <http://mesh.brown.edu/dlanman/scan3d>.

5.1 Data Capture

5.1.1 Scanner Hardware

As shown in Figure 5.1, the scanning apparatus contains one or more digital cameras and a single digital projector. As with the swept-plane systems,
